
Mespas releases latest software version

www.mespas.com

Mespas reports that it has released version 5.12 of its fleet management software system, mespas R5.

The new release features four new modules: TMSA II, Form Manager, Noon Report and Crew Management Light, while the company says that existing modules have additionally been enhanced.

An accounting interface has also been added to allow shipping companies to integrate business data from mespas R5 into the user's own accounting software.

Mespas says that this interface developed as a consequence of expressed customer requirements for a flexible, secure data interchange between operations data stored on different software packages.

Mespas R5 features an XLM specification for interaction with existing accounting systems, which can allow the data interchange to be integrated, or parameters to be added so that tasks can be scheduled according to the requirements of the ship operator.

"We pride ourselves in developing software that takes into account the real needs of our users, that is, crew on board as well as office users on-shore," said Daniel Gsponer, chief technology officer of Mespas.

"All new modules are developed in close collaboration with ship owners and affiliated businesses and ideally supplement the current set of mespas R5 modules."

Upgrades of the software system will be free for existing customers.
